

General Technical Information

Cemented Carbide products safety standard

1、Safety responsibilities

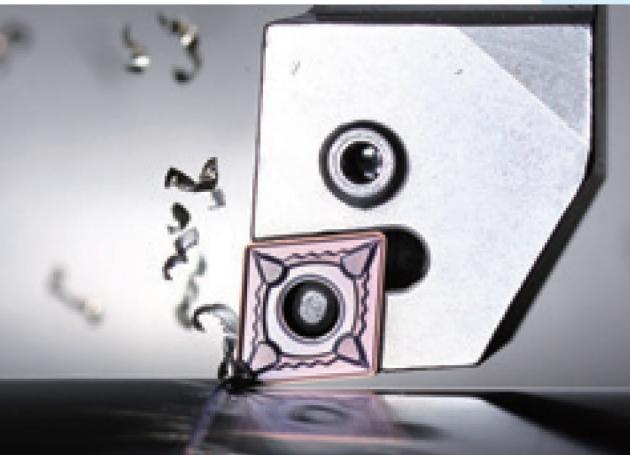

Before using ZCCCT products, please provide necessary safety training for operators, and carefully read the 'NOTE' and 'CAUTION' contents on the product package. We are not liable for any responsibility caused by not complying with the request for operation.

2、Features of cemented carbide materials

Cemented carbide cutting tools are mainly composed of W, C, Co, N, Ti, Si, Al, O, etc elements and their chemical compound, and come into shape after sintering and a series of subsequent machining. Cemented carbide tool has good chemical stability and high strength. It is the ideal tool to cut most metals and high-strength nonmetals.

3、Cautions for safely using cemented carbide tools

- 1) Cemented carbide is hard and frangible material, liable to brittle rupture and breakage due to larger force or partial stress, which causes sharp edge.
- 2) Most cemented carbide is mainly composed of W and Co with high density. In the process of transport and storage, it should be treated as great heavy object and be handled with care.
- 3) Cemented carbide and steel have different thermal expansion coefficients. To avoid breakage caused by concentrated stress, welding should be conducted under suitable temperature.
- 4) Cemented carbide tools should be stored in dry environment, away from corrosive atmosphere.
- 5) In the cutting process, it is unavoidable to generate chips and brittle discs, etc. Please make sure necessary labor protection articles are prepared before machining.
- 6) If coolant is needed in the cutting process, please select correct coolant to prolong machine and tool life.
- 7) If cracks are generated in the machining process, please stop using the tool.
- 8) Long use of cemented carbide tool will lead to cutting edge passivation and lower strength. Please make sure it is regrinded by professionals
- 9) Please collect the broken tools and chips properly to avoid injury to other people.

Cautions for safely using cutting tools

Danger	Protective measure
Direct contact with the sharp cutting edges may cause injuries.	Please use labor protection articles such as gloves when assembling or disassembling cutting tools on machine.
Improper use of tools may cause tool breakage and expulsion from machine, causing injuries.	Please read catalogue and safety standard before operating. Please wear safeguard glasses and protective clothes.
Rapid increase of cutting resistance due to excessive abrasion and severe impact may lead to breakage of tool and spatter of chips, thus cause injuries to operator.	Change the tool with excessive abrasion without delay. Please wear safeguard glasses and protective clothes.
In the cutting process, hot chips may cause scald and scratch on operator.	Please use tools such as pliers to clear away the chips in time. Please wear safeguard glasses and protective clothes.
In cutting process, sparks and hot chips may cause fire and explosion hazard.	Clear away the inflammable and explosive materials in the cutting area. Please make sure the fire extinguishers are ready for use.
At high speed, the machine will vibrate severely because of poor balance of holder, causing tool breakage.	Check whether the machine is loose or has any abnormal noise before cutting. Please wear safeguard glasses and protective clothes.
Burrs on workpiece are very sharp and likely to cause injuries.	Do not touch the burrs on the workpiece with bare hand. Please wear protective gloves and clothes.
Machining workpiece held infirmly will cause tool breakage and spatter of workpiece.	Make sure the workpiece is clamped firmly. Please wear safeguard glasses and protective clothes.
If inserts or spare parts are not clamped properly, they may become loose and fly off, causing risk of injuries.	Make sure the inserts and spare parts are clamped firmly before machining.
If Inserts and tool are clamped too tightly with screw and clamp, they face the risk of breakage and spatter.	Please do not clamp tools too tightly with bushing.
Inserts or spare parts may fly off due to inertial centrifugal force at high cutting speed.	Use the tools within recommended cutting conditions. Please wear safeguard glasses and protective clothes.
Milling cutters have sharp cutting edges and direct contact with them may cause injuries.	For your safety, please wear protective gloves if you need to touch inserts.
During rotary cutting, clothes, gloves, etc. are easily to get wringed in the machine at high speed, thus cause casualties.	The operator should not wear gloves during rotary cutting. Please pay attention that the clothes should not contact the operational parts of machine.
Off-center or poor balance of tools in rotating machining will cause vibration, breakage and splash of tool, thus will cause injuries.	Please use the tools within the range of recommended rotating speed. Check and adjust machine balance periodically.
During cutting at high speed, the chips flying off rapidly may cause injuries.	Safeguard articles such as protective cover, screen, etc. should be used. Please wear safeguard glasses, protective clothes and gloves.
Using the extremely small drill is likely to cause tool breakage and spatter, and it would be hard to take out the broken part.	Reduce tool vibration and conduct machining at suitable speed. Please wear safeguard glasses, protective clothes and gloves.
Machine and tools may be damaged if they are used beside the range of specified purposes, thus may cause other risks.	Please use them strictly according to instructions and specified purposes.

Note: We are not responsible for any accidents caused by private modified tools without our permission.

Threading pre-hole diameter

● Metric common thread

Thread code	Recommended hole diameter (mm)

Surface roughness

The surface roughness refers to the small space and unevenness from peak to valley on workpiece surface.

Surface roughness has close relationship with the matching property of machine elements, wear resistance, machining precision and corrosion resistance. It influences the reliability and life of machine and instrument.

Type	Code	Calculation method	Calculation example (figure)
Arithmetic average deviation of profile	R _a	<p>Within sampling length l, the arithmetic average absolute value of profile deviation is</p> $R_a = \frac{1}{l} \int_0^l y(x) dx$ <p>In the formula, the profile deviation y is the distance between profile points and reference line in the measuring direction. Reference line is the profile least-square average line O. This line divides the profile and makes the sum of squares of profile deviation to be the minimum within the sampling length.</p>	
Irregularity Ten-point height	R _z	<p>Within sampling length l, the sum of the average value of heights of five highest profile peak and the depths of five deepest profile valleys</p> $R_z = \frac{\sum_{i=1}^5 y_{pi} + \sum_{i=1}^5 y_{vi}}{5}$ <p>In the formula, y_{pi} means the height of the i'th highest profile peak. In the formula, y_{vi} means the depth of the i'th deepest profile valley.</p> <p>Maximum height of profile R_y: the distance between the top profile peak line and the bottom profile valley line in the longitudinal direction within the sampling length l.</p>	
Maximum height of profile	R _y	<p>The distance between the inner profile peak line and the bottom profile valley line in the longitudinal direction within the sampling length l. Top profile peak line is the line that parallels to the reference line and passes through the highest point of profile peak. Bottom profile line is the line that parallels to the reference line and passes through the lowest point of profile valley.</p>	

The value of sampling length l and evaluated length ln

R _a / μm	R _z / μm	l/mm	ln=5l /mm
≥0.008~0.02	≥0.025~0.10	0.08	0.4
>0.02~0.1	>0.1~0.50	0.25	1.25
>0.1~0.2	>0.50~10.0	0.8	4.0
>0.2~10.0	>10.0~50.0	2.5	12.5
>10.0~80.0	>50~320	8.0	40.0

Note:

1. From IT1 to IT5, the standard tolerance with basic dimension more than 500 mm is on trial.
2. When the basic dimension ≤ 1 mm, the tolerances from IT4 to IT8 are invalid.

The shaft lower deviation(ei) and upper deviation (es) can be obtained by basic tolerance and standard tolerance (IT) of shaft.

The hole lower deviation(EI) and upper deviation (ES) can be obtained by basic tolerance and standard tolerance (IT) of hole.

For example: for a hole with diameter 3 mm and tolerance H7, we can find that the lower deviation $EI=0$ in relation to H7 from the basic tolerance table, and the standard tolerance $IT=10\mu m$ corresponding to H7, thus the upper deviation $ES=EI+IT=10\mu m$. Therefore the hole fitting dimension is $\varnothing 3^{+0.01}_0$ mm.

In the formula Deviation = $\pm \frac{IT_n}{2}$, ITn is the IT value corresponding to 'n' .

Note: 1. If basic dimension $\leq 1\text{mm}$, the basic deviation a and b are not adopted.

2. Within the range from js7 to js11, if the value of ITn is odd number, then the final deviation = $\pm \frac{IT_n - 1}{2}$.

In the formula Deviation = $\pm \frac{IT_n}{2}$, ITn is the IT value corresponding to 'n'.

If $IT \geq IT_7$, add a Δ value to the relevant value

Note: 1. If basic dimension ≤1mm, the basic deviation A and B are not adopted, so is the N when $IT \geq IT_8$.

2. Within the range from JS7 to JS11, if the value of ITn is odd number, then the final deviation = $\pm \frac{IT_{n-1}}{2}$.

3. Regarding to the K,M, N with $IT \leq IT_8$ or the P to ZC with $IT \leq IT_7$, the Δ value can be selected from the right-side sheet.

For example: within the range 8~30mm of K7, $\Delta=8\mu m$, therefore $ES=-2+8=+6\mu m$ within the range 18~30mm of S6: $\Delta=4\mu m$, therefore $ES=-35+4=-31\mu m$.

4. Special cases: within the range 250~315mm of M5, $ES=-9\mu m$ (instead $-11\mu m$).

Note: The conversion values for steel in the table are commonly applicable for the steels with low and high carbon content.

The tensile strength in the table are applicable for the steels without high conversion precision requirement 1N/mm²=1Mpa.

This table is selected from GB1172-74.

Safety & environmental protection

Cemented carbide products are hard and fragile, which are easily damaged due to improper carrying or clamping, so please be careful with them.

Spattering of chips may occur and a lot of cooling liquid is used during the machining process, so protective measures should be used, such as ventilating equipment, machine protective shield, safeguard glasses, protective clothes, and so on. Please take care to protect hand when clamping inserts with sharp edge.

Welcome to call our technical service hotline: 4008815915

Quality guarantee

We have been awarded GB/T19001-ISO9001 Quality System Certificate.
All our products are inspected strictly.

Zhuzhou Cemented Carbide Cutting Tool Co.Ltd(ZCCCT) is the research, production and sales base of CNC cutting tools with large production scale, advanced equipments and leading technology strength in China.

—Starting from the very beginning of material selection, we strictly control each procedure and implement refined management to guarantee the stable quality of products.

—Our research and application experts constantly pay close attention to the latest development of materials and cutting technology to provide high-quality and high-efficiency cutting tools and complete solutions to our customers.

—Our sales and service network can be found all over China and spanning the globe. We offer considerate and professional technology services regarding orders of standard or non-standard tailor-made products.
